

## TEL 300 - TELEPHONE HYBRIDS

Telephone insert - balanced - XLR

The TEL 300 can be adapted to any type of console equipped with a specific channel (N - 1) , such as COMPACT or RP 2000. The use of an auxillary send can be an alternative for consoles that do not have a specific channel.

With the TEL 300 you can:

- Send the signal from the desk to the correspondent.
- Mix the correspondent's interventions with the signal from the desk.
- Switch between the private telephone line to the hybrid.
- Send instructions to the correspondent.
- Listen to the correspondent only.

The use of a band-pass filter on the correspondent's send allows it to conform to the calibre of the networks whilst improving the antilocal reinjection rate.

All the inputs / outputs are XLR balanced.

The ON AIR commutation can be done either on the front panel or by remote control from the console.

The TEL 300 S serie allow the automatic connection and disconnection of the phone line.

### Applications :

- Classic telephone insert for games, debates or conferences.
- Use in the press room to create "documents". The only requirements are a microphone, headphones and a recording unit.
- The TEL 300S version has the automatic switching to carry out long distance interventions or to connect on to an order network.
